

# Convolutional Neural Network

Hung-yi Lee

Can the network be simplified by  
considering the properties of images?

# Why CNN for Image

- Some patterns are much smaller than the whole image

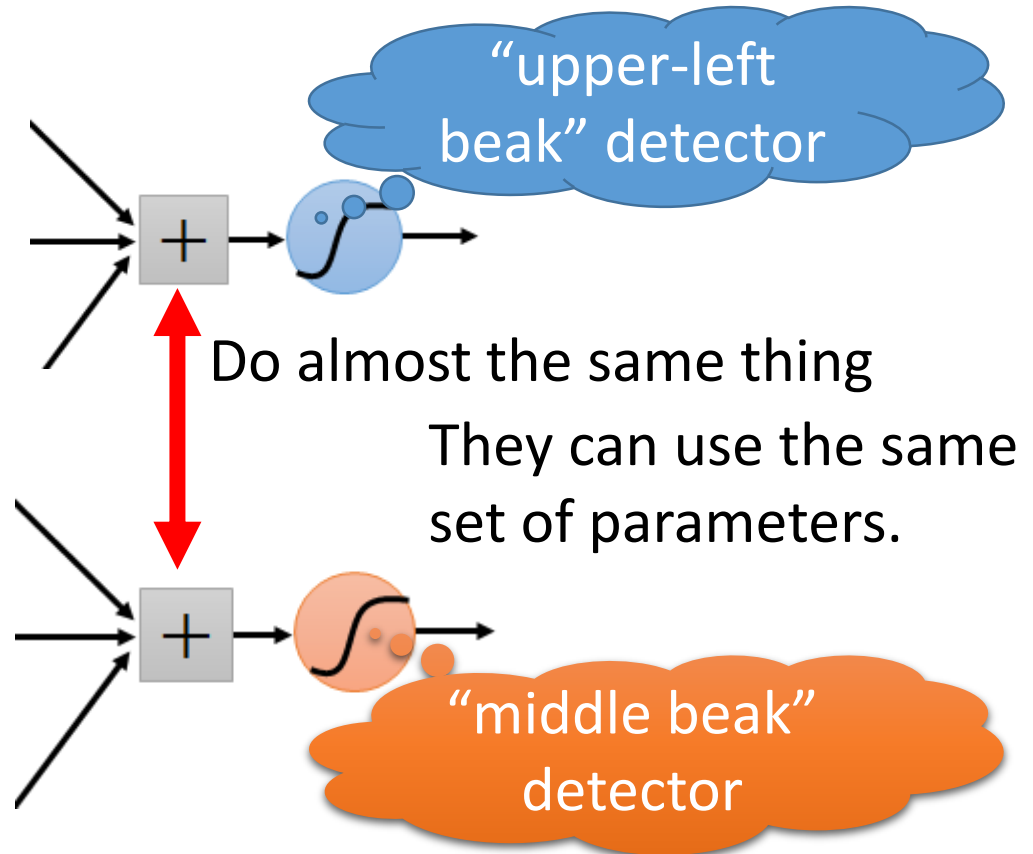

A neuron does not have to see the whole image to discover the pattern.

Connecting to small region with less parameters

# Why CNN for Image

- The same patterns appear in different regions.

# Why CNN for Image

- Subsampling the pixels will not change the object

bird

subsampling

bird

We can subsample the pixels to make image smaller

Less parameters for the network to process the image

# The whole CNN

# The whole CNN

## Property 1

- Some patterns are much smaller than the whole image

## Property 2

- The same patterns appear in different regions.

## Property 3

- Subsampling the pixels will not change the object

# What does CNN learn?

The output of the k-th filter is a 11 x 11 matrix.

Degree of the activation of the k-th filter:

$$a^k = \sum_{i=1}^{11} \sum_{j=1}^{11} a_{ij}^k$$

$x^* = \arg \max_x a^k$  (gradient ascent)

## What does CNN learn?

The output of the k-th filter is a 11 x 11 matrix.

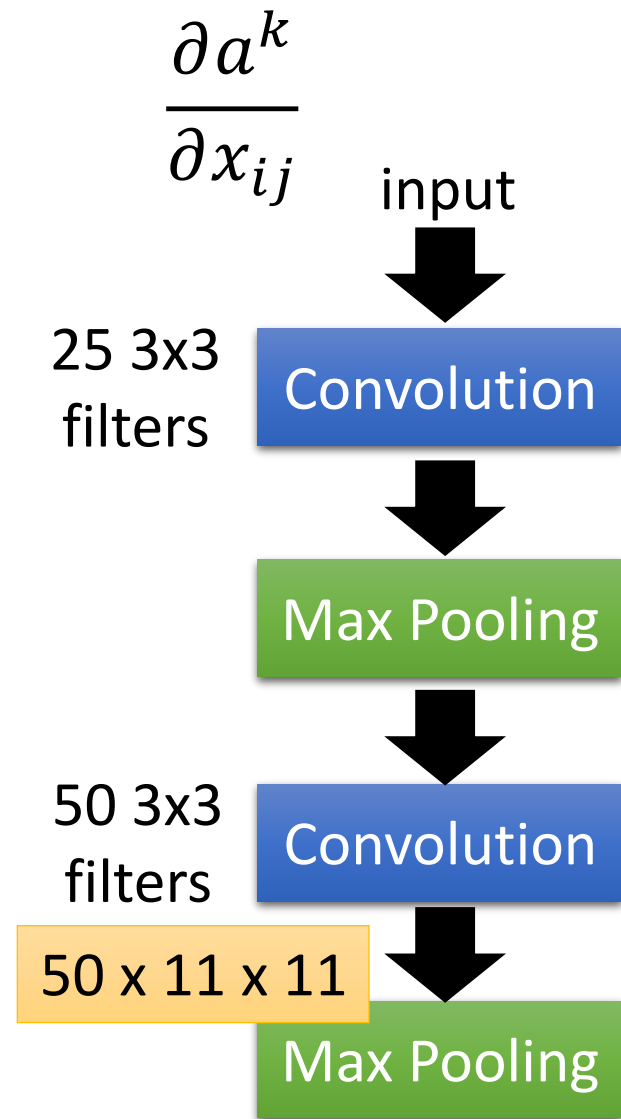

Degree of the activation of the k-th filter:

$$a^k = \sum_{i=1}^{11} \sum_{j=1}^{11} a_{ij}^k$$

$x^* = \arg \max_x a^k$  (gradient ascent)

For each filter

# What does CNN learn?

Find an image maximizing the output of neuron:

$$x^* = \arg \max_x a^j$$

Each figure corresponds to a neuron

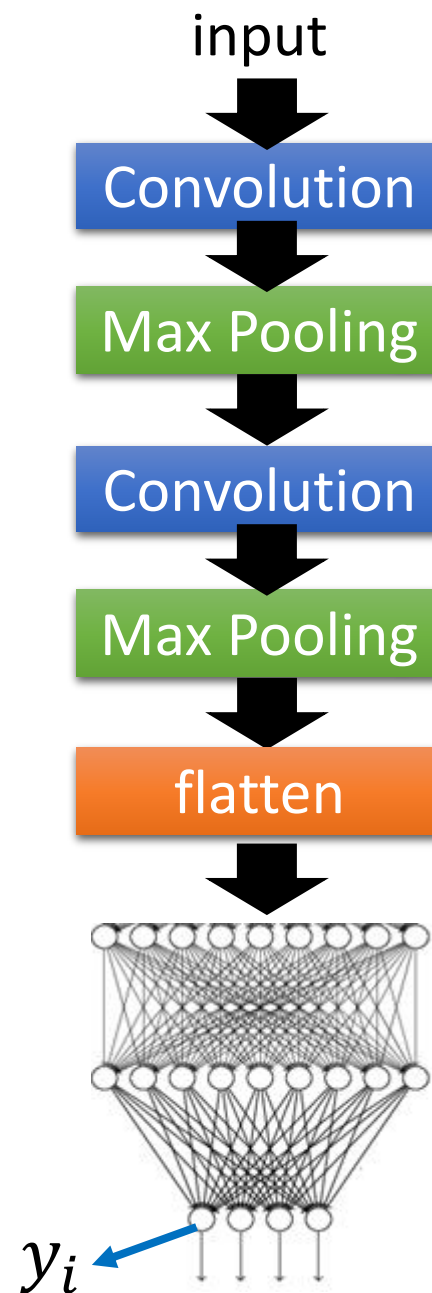

# What does CNN learn?

$$x^* = \arg \max_x y^i \quad \text{Can we see digits?}$$

Deep Neural Networks are Easily Fooled

<https://www.youtube.com/watch?v=M2lebCN9Ht4>

# What does CNN learn?

$$x^* = \arg \max_x y^i$$

Over all  
pixel values

$$x^* = \arg \max_x \left( y^i - \sum_{i,j} |x_{ij}| \right)$$

# More Application: Playing Go

Black: 1  
white: -1  
none: 0

Network

Next move  
(19 x 19  
positions)

19 x 19 vector

Fully-connected feedforward  
network can be used

But CNN performs much better.

# More Application: Playing Go

Training: record of previous plays 黒: 5之五 → 白: 天元 → 黒: 五之5 ...

Target:  
“天元” = 1  
else = 0

Target:  
“五之5” = 1  
else = 0

# Why CNN for playing Go?

- Some patterns are much smaller than the whole image

Alpha Go uses 5 x 5 for first layer

- The same patterns appear in different regions.

# Why CNN for playing Go?

- Subsampling the pixels will not change the object

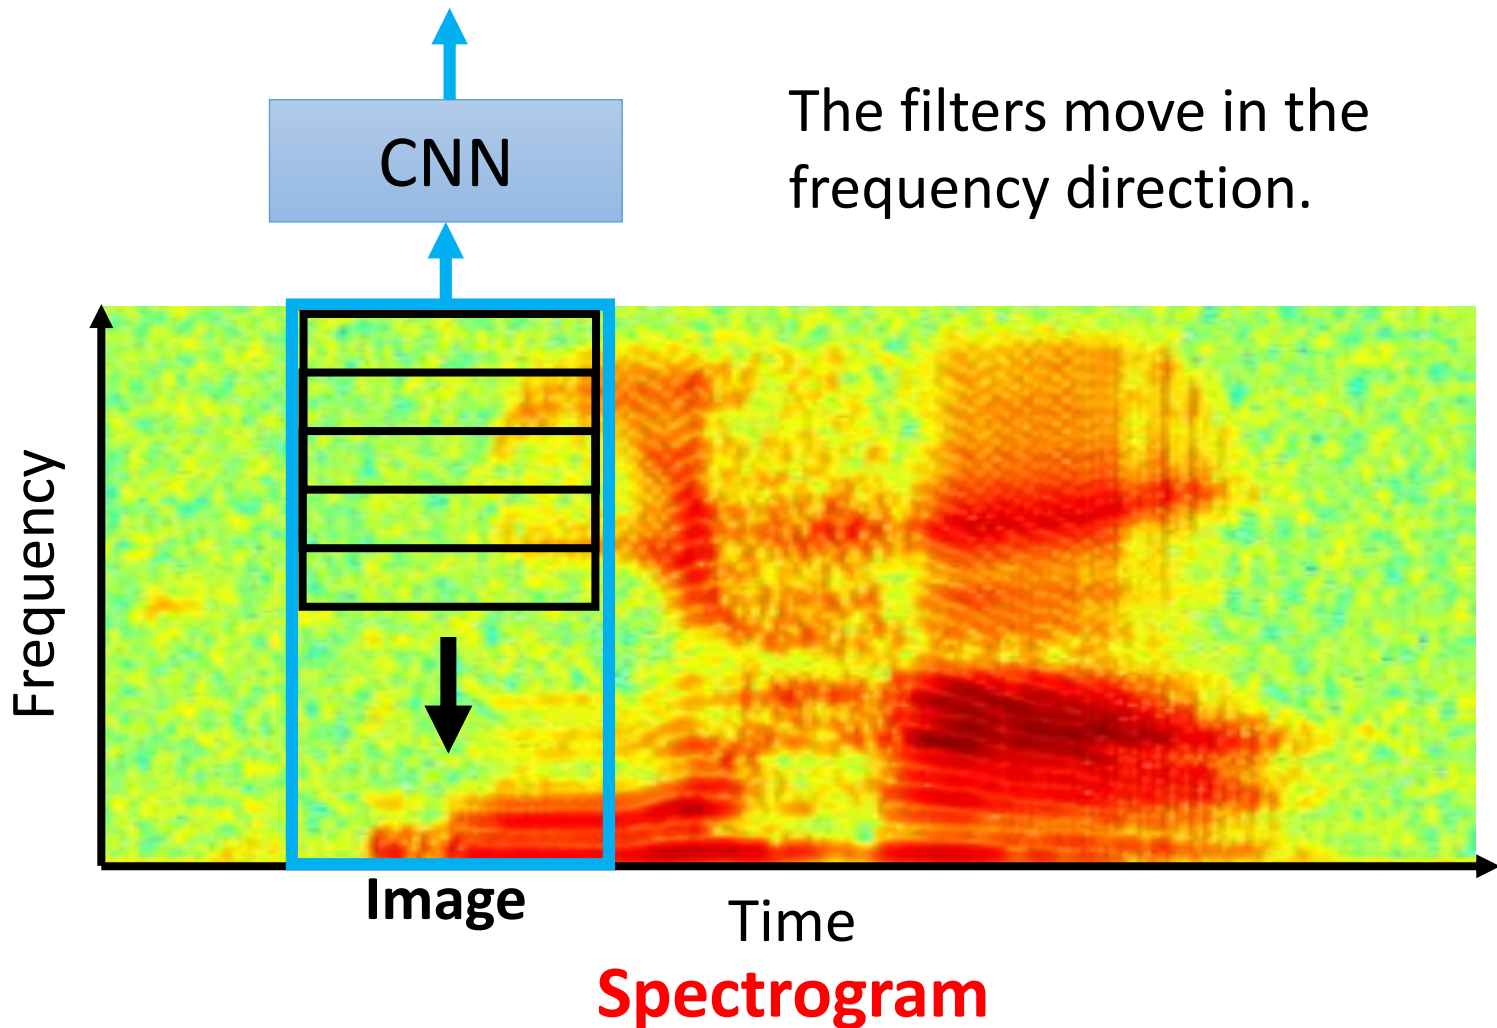

Max Pooling

How to explain this???

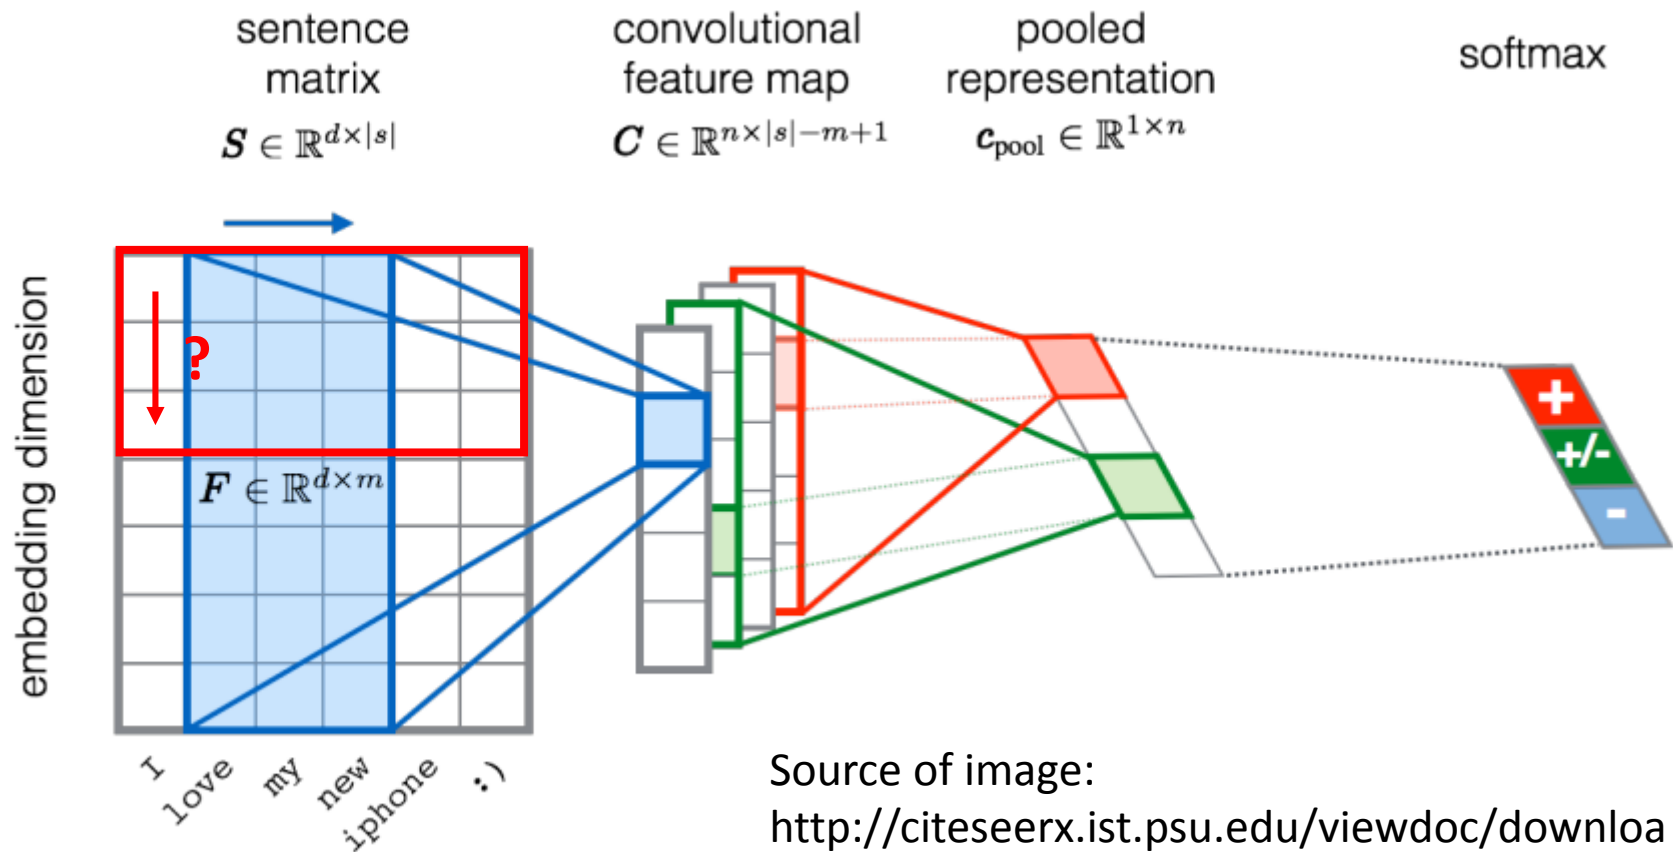

**Neural network architecture.** The input to the policy network is a  $19 \times 19 \times 48$  image stack consisting of 48 feature planes. The first hidden layer zero pads the input into a  $23 \times 23$  image, then convolves  $k$  filters of kernel size  $5 \times 5$  with stride 1 with the input image and applies a rectifier nonlinearity. Each of the subsequent hidden layers 2 to 12 zero pads the respective previous hidden layer into a  $21 \times 21$  image, then convolves  $k$  filters of kernel size  $3 \times 3$  with stride 1, again followed by a rectifier nonlinearity. The final layer convolves 1 filter of kernel size  $1 \times 1$  with stride 1, with a different bias for each position, and applies a softmax function. The

Alpha Go does not use Max Pooling ..... Extended Data Table 3 additionally show the results of training with  $k = 128, 256$  and 384 filters.
